StanCon

Stan Eminem

My tea's gone cold
I'm wondering why I got out of bed at all
The morning rain clouds up my window
And I can't see at all
And even if I could it'd all be gray
But your picture on my wall
It reminds me that it's not so bad, it's not so bad

Dear Slim, I wrote you, but you still ain't callin'
I left my cell, my pager and my home phone at the bottom
I sent two letters back in autumn, you must not've got 'em
There probably was a problem at the post office or somethin'
Sometimes I scribble addresses too sloppy when I jot 'em

Stanislaw Ulam

Stan[®] is a state-of-the-art platform for statistical modeling and high-performance statistical computation. Thousands of users rely on Stan for statistical modeling, data analysis, and prediction in the social, biological, and physical sciences, engineering, and business.

Users specify log density functions in Stan's probabilistic programming language and get:

- full Bayesian statistical inference with MCMC sampling (NUTS, HMC)
- approximate Bayesian inference with variational inference (ADVI)
- penalized maximum likelihood estimation with optimization (L-BFGS)

Example 1: Eight Schools

This is an example in Section 5.5 of Gelman *et al* (2003), which studied coaching effects from eight schools. For simplicity, we call this example "eight schools."

We start by writing a Stan program for the model in a text file. If you are using RStudio version 1.2.x or greater, click on File -> New File -> Stan File . Otherwise, open your favorite text editor. Either way, paste in the following and save your work to a file called `8schools.stan` in R's working directory (which can be seen by executing `getwd()`)

```
// saved as 8schools.stan
data {
  int<lower=0> J;          // number of schools
  real y[J];              // estimated treatment effects
  real<lower=0> sigma[J]; // standard error of effect estimates
}
parameters {
  real mu;                // population treatment effect
  real<lower=0> tau;       // standard deviation in treatment effects
  vector[J] eta;          // unscaled deviation from mu by school
}
transformed parameters {
  vector[J] theta = mu + tau * eta; // school treatment effects
}
model {
  target += normal_lpdf(eta | 0, 1); // prior log-density
  target += normal_lpdf(y | theta, sigma); // log-likelihood
}
```

<https://github.com/stan-dev/rstan/wiki/RStan-Getting-Started#example-1-eight-schools>

	school	y	sigma
1	A	28	15
2	B	8	10
3	C	-3	16
4	D	7	11
5	E	-1	9
6	F	1	11
7	G	18	10
8	H	12	18

StanCon 2018

Helsinki, 29-31 Aug

2018

One day of tutorials and two days of talks, open discussions, and statistical modeling in beautiful Helsinki, Finland.

<https://mc-stan.org/events/stancon2018Helsinki/>

Hierarchical modelling of galaxy clusters for Cosmology

Maggie Lieu, Will Farr, Michael Betancourt, Graham Smith, Mauro Sereno, Ian McCarthy, Paul Giles, Justin Alsing.

Typical route:

1

Fit galaxy shapes

caveats:
calibration, errors

2

Fit shear profiles

caveats: priors,
binning, stacking,
centering, errors

3

Fit scaling relation

caveats: fit type,
biases, selection
effects, errors

4

Fit cluster mass function

caveats:
propagation of
errors

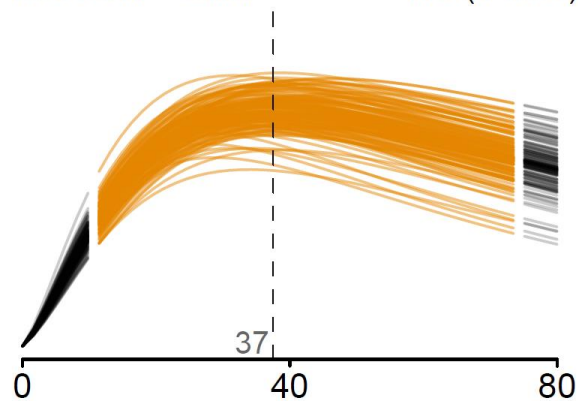

Bad Data, Big Models & Statistical Methods for Studying Evolution

Dose-Finding Clinical Trials in Stan

Kristian Brock, StanCon Helsinki, 30-Aug-18

<https://cran.r-project.org/package=trialr>

In conclusion

- I went to StanCon 2018 Helsinki.
- You should go to the next one, if...
 - you're interested in Bayesian statistics: last year was great.
 - you're not interested in Bayesian statistics: you will be afterwards.
- (I don't know when it's going to be.)
